

Passive fire protection for building structures

We make the difference

Skamol Group develops, produces and distributes insulation construction material for a wide range of heat-intensive industry sectors, as well as for passive fire protection, fireplace enclosures and for mould prevention.

With our products and solutions, we would like to help our partners and customers gain considerable added value and at the same time make our contribution to the environment. With the use of our unique materials we are able to benefit from many advantages, including energy savings, greater performance, better working and living conditions and even lower CO2 emissions.

Skamol was founded in Denmark in 1912, with the purpose of utilizing the local deposits of the unique diatomaceous earth, also known as moler.

Since then, the company has grown into a leading, global supplier of technical insulation systems for both industrial and private use. Besides the use of moler (diatomite), we have expanded our product range to include vermiculite and calcium silicate.

At the front edge of developing technical insulation systems

As a modern company, we are among the world leaders in research and system development, as well as new techniques and technologies. Our production plants in Denmark, Poland and Russia are kept state-of-the-art to ensure continuously high system quality; an attribute that often proves vital for our customers.

We believe in the value of close cooperation and dialogue. Just like we develop new products with new properties, we improve and modify existing systems. In doing so, we pay particular attention to our customers' requests and consider the market requirement in general.

Fire protection for steel structures

The serious alternative to conventional solutions for the passive fire protection of steel constructions

Skamol now offers the market a serious alternative to conventional solutions for the passive fire protection of steel constructions.

For years the unique solutions on the market were “cement-bound fire protection boards” or fire-resistant plasterboards for these applications, and SkamoStructure offers a real alternative.

The SkamoStructure Board 250 consists of calcium silicate and offers considerable advantages compared to conventional solutions.

Our advantage: The simplest handling

One factor makes SkamoStructure stand out in particular: Our boards are extremely light. This means the material can be handled very easily. Attaching it is no problem either – see page 7 for all of the attachment methods that can be used to mount SkamoStructure exactly where it's needed.

The protection of load-bearing structural elements against fire is a decisive factor in order to meet state building codes with respect to fire protection and thus to ensure the structural stability of a building in the event of a fire. Our SkamoStructure lightweight construction system is the perfect solution for protecting steel building structures. No matter whether it's for open profiles, closed profiles or columns: SkamoStructure is ETA certified and reliably protects the building structure.

Cement-bound fire protection boards.

SkamoStructure Board 250
Weight reduction of around 45% compared to other products on the market.

Lightweight

SkamoStructure Board 250 weighs just 250kg/m³.

Quick mounting

SkamoStructure is quick and easy to mount.

Fire protection

SkamoStructure is a Class A1 construction material.

Easy to handle

SkamoStructure can be handled without the need for any special tools.

Application areas

Beam with open profile.

Beam with closed profile.

Versatile and absolutely safe – important arguments that speak for SkamoStructure

SkamoStructure can be used to protect all relevant parts of the building structure: Columns, beams and supports can all be clad regardless whether as open or closed profiles.

Column with open profile.

Construction steel

Construction regulations stipulate how long some construction elements must be able to withstand fire in the event that a fire breaks out. The necessary structural fire protection depends on the following factors:

- Predetermined fire resistance time
- Shape and size of the steel element
- Proportion of the steel profile exposed to fire
- Type of fire protection used

The SkamoStructure system has been tested in approved labs according to the testing procedure for determining the contribution to fire resistance of load-bearing structural components (EN 13381-4).

The system is approved for load-bearing steel beams and columns in accordance with ETA-11/00469. The SkamoStructure Board is used as square cladding for open and hollow profiles to protect the steel.

Thickness of the SkamoStructure Board 250

The section factor, the critical steel temperature and the fire resistance requirement must be taken into account when selecting the board thickness.

Box protection.

Profile protection.

Section factor

The section factor is a parameter used to determine the thermal behaviour of steel structural components. The fundamental factors are the rate at which the steel supports and columns heat up proportional to the area exposed to fire (A_p) and in reverse proportion to the volume of the steel profile (V). The section factor is calculated using the formula A_p/V and measured in m^{-1} , and the value depends on whether the area of the steel beam exposed to fire is 3-sided or 4-sided and the structural component thickness. The section factor for steel profiles can be provided by the supplier of the steel.

Critical steel temperature

The critical steel temperature specifies at what temperature structural weaknesses could occur because of the fire. The critical steel temperature can be provided by the supplier of the steel.

Fire resistance requirement

Construction regulations stipulate how long some construction elements must be able to withstand the fire in the event that a fire breaks out.

SkamoStructure Board 250 sizes

Product number	Size	Packaging	m ² / packaging	Piece per pallet
24160001	2,440 × 1,220 × 22mm	Piece	2.98m ²	47
24160002	2,440 × 1,220 × 25mm	Piece	2.98m ²	42
24160003	2,440 × 1,220 × 30mm	Piece	2.98m ²	35
24160004	2,440 × 1,220 × 35mm	Piece	2.98m ²	30
24160005	2,440 × 1,220 × 40mm	Piece	2.98m ²	26
24160007	2,440 × 1,220 × 45mm	Piece	2.98m ²	23
24160008	2,440 × 1,220 × 50mm	Piece	2.98m ²	21
24160009	2,440 × 1,220 × 55mm	Piece	2.98m ²	19
24160010	2,440 × 1,220 × 60mm	Piece	2.98m ²	17

Mounting

The SkamoStructure Board is attached using screws or shot nails with a 30mm washer, as listed in table.

SkamoStructure Board 250	Screws for open and closed profiles		Shot nails with 30mm washers for closed profiles	
Thickness	Maximum screw spacing	Screw dimensions	Maximum shot nail spacing	Nail length
22	340mm	3.8 × 45mm	-	-
25	340mm	3.8 × 45mm	460mm	37mm
30	340mm	4.0 × 60mm	460mm	42mm
35	340mm	4.0 × 70mm	460mm	47mm
40	340mm	5.0 × 80mm	460mm	52mm
45	340mm	5.0 × 90mm	460mm	57mm
50	340mm	5.0 × 90mm	460mm	62mm
55	340mm	5.0 × 100mm	-	-
60	340mm	5.0 × 110mm	-	-

Skamol recommends the use of galvanised wood/multi-material screws and shot nails with the dimensions, as specified above in the table.

For mounting under trapeze ceilings Skamol recommends the use of drywall/particle board screws in accordance with the dimension in the mounting table above.

3-sided square cladding

All dimensions are in mm.

Position of screws in open profiled steel – three-sided protection

For a more rigid structure the board joints should be offset by ≥ 300 mm

The structural supports should be sawn off with a minimum width of 200 mm and 1-2 mm excess in the height, so that they can be pressed in between the flanges. The structural supports should be cut with the same sheet thickness as the formwork. The columns should be affixed to every joint and at a maximum distance of 1200 mm from one another.

See screw information on page 7.

4-sided square cladding

All dimensions are inmm.

Position of screws in open profiled steel – four-sided protection

For a more rigid structure the board joints should be offset by $\geq 300\text{mm}$

See screw information on page 7.

© 2006 The Authors
Journal compilation © 2006 Blackwell Publishing Ltd

For a more rigid structure the board joints should be offset by $\geq 300\text{mm}$.

10

4-sided square cladding

All dimensions are inmm.

t = SkamoStructure Board 250 thickness.

Position of shot nails in closed profiled steel – four-sided protection

For a more rigid structure the board joints should be offset by $\geq 300\text{mm}$.

See screw information on page 7.

4-sided square cladding

All dimensions inmm.

Position of screws in closed profiled steel – four-sided protection

For a more rigid structure the board joints should be offset by $\geq 300\text{mm}$.

See screw information on page 7.

Datasheet: SkamoStructure Board 250

	Value	Unit

Find the applicable board thickness

For the dimensioning of fire protection of steel structures, it is important to identify the critical steel temperature for the steel profile. The critical steel temperature appears on the project material or can be specified by the project consultant.

Apart from the critical steel temperature the A_p/V ratio (section factor) of the steel profile which needs to be protected, must also be taken into consideration. The tables on page 16 show the section factor of the most common steel profile.

When you know the A_p/V ratio for the steel profile, you can determine which SkamoStructure Board 250 thickness is to be used at a critical temperature of 500°C in the table to right.

Formula for calculating the A_p/V ratio for box protection

A_p = inner circumference of the shielding.
 A_p is the sum of the inner circumference of the smallest possible rectangle or square.

V = cross-sectional area of the profile.

After calculation of the A_p/V value the section factor of the box protection must always be rounded up.

Critical temperature of 500°C (open profile)

Time (min)	A_p/V	Thickness (mm)
30	40-400	22
60	40-185	22

Examples for the calculation of cladding

Examples for the calculation of three-sided cladding

A steel profile, IPE 200, must be fire-protected from three sides, and the fire resistance must be R60.

$$\begin{aligned} A_p &= 2 \times 0.20\text{m} + 0.10\text{m} = 0.50\text{m} \\ V &= 2,850\text{mm}^2 \approx 0.00285\text{m}^2 \\ A_p/V &= 0.50\text{m} / 0.00285\text{m}^2 \approx 176\text{m}^{-1} \end{aligned}$$

Thickness of SkamoStructure Board 250 according to table on page 14 = 22mm

Examples for the calculation of four-sided cladding

A steel profile, HE 120 A, must be fire-protected from three sides, and the fire resistance must be R90.

$$\begin{aligned} A_p &= 2 \times 0.114\text{m} + 2 \times 0.120\text{m} = 0.468\text{m} \\ V &= 2,534\text{mm}^2 \approx 0.002534\text{m}^2 \\ A_p/V &= 0.468\text{m} / 0.002534\text{m}^2 \approx 184\text{m}^{-1} \end{aligned}$$

Thickness of SkamoStructure Board 250 according to table on page 14 = 40mm

Ap/V ratio

Ap/V ratio for the most commonly used steel profile is shown in the table below.

Square (mm)	3-sided	4-sided
100 × 100 × 4	198	264
100 × 100 × 5	161	214
100 × 100 × 6	136	181
100 × 100 × 8	105	139
100 × 100 × 10	86	115

SkamoStructure Board 250 protected steel beams mounted under trapeze ceilings

Assessed DK R30 to R180

- The section factor for the beam must be calculated as a 4-sided fire exposure.
- The surface area of contact between the top flange of the beam and the trapeze ceiling must be 40% or lower than the total top surface area of the beam.
- The thickness of the SkamoStructure Board 250 are given in the attached design tables and must be the same for the sides and the top blocking piece placed between the trapeze profile.
- The trapeze ceiling must be filled with a non-combustible material e.g. mineral wool and must not contain air gaps.
- The thickness of the steel sheeting of the trapeze ceiling must be 1.2mm or lower.
- All gaps between the SkamoStructure Board 250 and the trapeze ceiling must be filled with fire sealant.
- Drawings of the construction with the assessed changes is attached to this assessment.
- The assessment is only valid for the requirements in test standard ENV 13381-4: 2002.
- All other details must be constructed as described in assessment report PH13583_rev1.

30minutes fire resistance: Steel beams mounted under trapeze ceilings

Our production plants

Thanks to our modernised and automated production plants in Skamol Branden and Skamol Opole, our technical insulation systems have achieved a unique quality level in terms of stability and characteristics. Not only has this led to a high and consistent quality, but also to an efficient processing of standardised solutions and fast delivery times.

One of the most significant advantages of our calcium silicate boards is that they are extremely light and do not break under extreme temperatures or severe temperature fluctuations.

Boards for versatile applications

The main product in our calcium silicate plants are boards, which can be used for a variety of insulation tasks. This includes, for example, the industrial high-temperature

insulation, the passive fire protection, mould prevention and fireplace cladding.

In addition to boards from bulk production, our customers can also order customised sizes in larger amounts. We are also able to conduct production tests and inspections on a small scale, to ensure an efficient production process for our customers, before commencing large-scale production.

The calcium silicate boards are either delivered to Skamol Roedding for further processing or sent directly to the customers as bulk deliveries, who can then perform the subsequent processing themselves.

Notes

Lined area for notes, consisting of multiple horizontal lines on a light gray background.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

All in **one**
